2.2 Layers of information

WhatsApp messages are built up in a hierarchy: a chat contains messages that contain tokens that contain characters. A corpus of WhatsApp chats should allow for all these layers to be queried. Additionally, there is meta-data about the chats (e.g. number of messages) and about the messages (e.g. the timestamp when they were written) and about the informant (e.g. his/her age) and about the tokens (e.g. part of speech). This makes our corpus a rather challenging and complex resource.

1/2

demographics_id		45			49							45				
gender		f			m							f				
age_range		18-24			25-34							18-24				
mothertongue		ita,Imo			ita							ita,Imo				
home_postcode		1004		3014							1004					
school_postcode					6500											
timestamp		30 mar 13:31			30 mar 13:32							30 mar 1	3:32			

These layers can nicely be seen when browsing results from a query:

that (complete)

Figure 1: Representation of layers when browsing results

Chats

In this example, you find the chat back as an ID (chat138) at the top in pink in figure 1. If you want to see the whole chat, you see two options at the very bottom: chat (in context) (faster) or chat (complete) (can be slow). When you click on the little i in the top bar, you can also see meta data about the chat, such as the number of speakers, languages, total messages etc.

Messages

In the chat in figure 1, you see three selected messages in blue:

- Message 165379: Anke adesso se vuoi
- Message 165380: Aeh ho solo 10 percento di batteria xo
- Message 165381: Ah ecco

As you can see, these messages have meta data assigned to them as well, e.g. the message ID and the speaker (these pieces of information are always available) as well as information provided by the informant such as age, mothertongue etc.

Tokens

The individual tokens are marked in green in figure 1 and they are aligned to the message to which they belong.

Tokens, too, (can) have annotations that are assigned to them. In figure 1 you have the following meta data:

- Gloss: a normalization, i.e. a "translation" into standard spelling. A good example here is *xo*, which was normalized as <però>.
- tt_pos: A part-of-speech annotation generated with TreeTagger.
- tt_lem: The lemma for each token as it was created by TreeTagger.

The red token *di*, by the way, is the one that we queried for to create this screen shot.

Labels

On all three layers, i.e. for chats, messages and tokens, as well as for all the meta data, you see the labels, e.g. msg_id, gloss, home_postcode etc. These labels are used for queries.

Examples:

- If you want to see the whole message 165380, your query is msg_id="165380"
- If you want to find verbs in the present tense, your query is tt_pos="VER:pres"

To see the query-labels for the chat as well as all the labels available in a specific sub-corpus, check the information for the sub-corpus.
